ABSTRACT

~~There may be sometimes caused a sense of incompatibility in the appearance of the colors, such as yellow looking darker, in a color image display using a red display, a green display, a blue display and a white display.~~

A color image processing apparatus ~~of performing the~~ performs color image display using ~~the a~~ red display, the green display, the blue display and the white display, ~~The apparatus includes comprising a~~ white signal generation circuit (1000) ~~of generating a white signal W based on an input red signal R_{in} for making the red display to be inputted, an input green signal G_{in} for making the green display to be inputted, and an input blue signal B_{in} for making the blue display to be inputted, a yellow signal generation circuit (2012) of generating a yellow signal Y_e , based on the input red signal R_{in} to be inputted, the input green signal G_{in} to be inputted, and the generated white signal W, and a first output white signal generation circuit (3012) of generating a first output white signal $W_{out}^{(1)}$ for making the white display to be outputted, based on the generated white signal W and the generated yellow signal Y_e .~~
